BSUM(17)

Historically, . . . programs interacted with the operating system, which after due processing gave tasks to software drivers that in turn communicated with **interface** cards ****dedicated**** to the particular ****peripheral****. A cable conveyed the final low-level hardware commands to a controller in the ****peripheral****. As the various enhancements, such as buffered ****I****/****O****, interrupt driven ****I****/****O****, DMA, and caching were developed to improve performance, corresponding changes were incorporated into the operating system, as well as into. . . the other software systems using those enhancements. In this way the range of capabilities and the degree of performance of ****peripheral**** mass storage subsystems were both increased and optimized.
